

ABSTRACT

DEVELOPMENT OF N-SHARE APPLICATION FOR MOBILE DATA TRANSFER

Most people do not consume their entire internet data (GB/MB) in a day. By using a hotspot connection only, we can share our internet data (GB/MB) for nearly available persons. Because of this issue, lots of daily internet data (GB/MB) were not used by most people. Without a hotspot, they can't transfer their Internet data to his/her families and friends. Suppose people have the option to share their non-used extra Internet data (GB/MB). To rectify that, we create an NSHARE app for mobile data transferring. This app gives an easy way to transfer their Internet data (GB/MB). The uniqueness of this APP is, like money transfer, our APP offers the facility to transfer Internet Data from one number to another number of same networks. You can transfer data instantly from one mobile to another using the data transferring system in our app. We can also schedule our work and use it accordingly by using this app. Most people don't use mobile data after 11 pm. The remaining unused data is scheduled for some work and used it. We can efficiently use our mobile data.
